Where the Cutting Station fits

optional module: the Cutting Station works without it

Stations

- Any tablet or computer at a cutting table becomes a station: open the Cutting Station address on it and a manager names it and chooses its location.
- Stations run full screen in their own look, separate from the admin, with large touch targets and a big number pad.
- A station shows the server's time in the store's time zone, so a wrong device clock cannot change when a cut was made.
- Rename, move, switch off, unlock or remove stations from the admin.
- Choose the label layout each station prints, to match the printer beside it.
- Station history: set up, changed, locked, unlocked, and every label cut, voided or printed again on it.

Signing in

- Tap your name and enter your PIN; nobody signs in to the station itself.
- With the Time Clock on, the Time Clock PIN is the Cutting Station PIN: one PIN everywhere, one lockout, unlocked in one place.

- Without the Time Clock, the Cutting Station keeps its own PINs: 4 to 32 numbers, easy PINs refused, set by the person at a station or by a manager.
- Everyone on staff can cut, or only the people a manager switches on; optionally held to their locations.
- One Lock button returns to the names; the work in progress stays on the station for the next person to Resume or Start new.
- Locks itself after a set time idle, and optionally re-locks a set time after each PIN — never in the middle of a cut.
- Refreshing the page keeps the person signed in on that tab; the station never keeps a PIN.

Cutting

- Scan the roll's bar code, or type a SKU or part of a name; found through the Shop's own product search.
- A bar code scanner works anywhere on the cutting screen and never types into the length.
- Limit the station to chosen product categories, or to the products on the Cut Products list.
- Length buttons for the lengths you cut most, and a big number pad for any other length.
- Feet, yards, inches, meters or centimeters, with a shortest cut and the steps a length goes in.
- Products sold in whole units are offered whole lengths only, by Inventory's own fractional rule.
- Price per unit and the total shown as you cut (optional), including sale prices.
- Mark a cut as a remnant (end of roll) for the remnant discount.
- Optional customer's name, printed on the label.
- After printing, the same product stays chosen for the next piece from the roll.

Labels and tickets

- Every label carries a ticket number bar code (Code 128), such as CT000123; the letters are yours to choose.
- One label per piece, or one label for all of a customer's cuts (up to 30).
- 1 to 10 copies of each label.
- Print a label again at the station or in the admin; every reprint is recorded.
- The person who cut a label can void it at the station for a set time; managers void any unsold ticket in the admin, with a reason.
- Tickets not paid for expire after a set time, checked every hour; an expired ticket can still be paid for.

At the register

- The cashier scans the label; the register adds each cut at its length and the customer pays.
- One scan adds every cut on a several-cut label.
- Voided labels and labels already paid for are refused.

- The ticket is marked sold with the order it was sold on.
- The register prices the sale itself; a remnant carries its discount to the register.

Hold and recall

- Hold the work on the station with an optional customer name and note, like the register's Hold.
- Recall it later from any station at the same location; each piece of work is recalled once.
- Recalled work comes back with today's names, prices and rules.

Waste

- Record waste on its own screen: scan, scan, scan — each piece a row with its own length and reason.
- Reasons are yours to set; one note covers the lot; every row is checked before anything is saved.
- The Waste screen and the Waste by reason report show what was lost and what it was worth.

Inventory

- Optional: a printed cut holds its length in Inventory until it is sold, voided or expires.
- Stock is held at the Inventory location the register sells from, using Inventory's own Reserve and Release.
- A label always prints, even when Inventory shows too little; the shortfall is noted for a manager.
- Optional: waste comes off the stock on hand as an Inventory adjustment.

Label Designer

- The same designer as the POS Receipt Designer and the Service & Repair Slip Designer.
- Built-in Indition basic labels for a 2.25" x 1.25" label and an 80mm receipt roll; duplicate to customize.
- Drag the pieces into rows, choose sizes, fonts and spacing, with a live preview at real size.
- Preview with a one-cut ticket, a three-cut ticket, or a real ticket number.
- Paper from POS's receipt rolls (58, 76, 80, 112mm) and Inventory's label rolls (thermal rolls, Dymo LabelWriter, Brother QL).
- Test print, inner margin per side, and printer alignment.
- Make default, retire or delete layouts; see which stations use each one.
- Manage Logos: one logo for every location, or one per location; optionally the same logos as POS and Service & Repair.

Admin

- Tickets: every label, its status, cuts, history and the order it sold on; Excel export.

- Reports: Cut but not sold, Cuts by employee, Cuts by product, Cuts by day, Waste by reason and Station activity, each with an Excel download.
- Cut Products: per-product unit, length buttons, shortest cut, steps and typed lengths; bulk changes; import and export.
- Employees: who can cut, their locations and PINs; bulk switch on and off; Excel export.
- Every grid has column filters, Export and Export Logs.

Protection against guessing

- Per person: pause their PIN for a set time, lock them until a manager unlocks them, or no limit.
- Per station: lock the station after too many failed tries in a set time; email chosen roles and people; unlock from the admin or by signing in on the station.
- Per username and per network address: block after too many failures; blocks end by themselves or a manager clears them.
- A full log of failed sign-ins (never the PIN or password typed), kept for the time you choose.

Access

- Cutting Station Admin and Cutting Station Manager roles; Store Admin administers the Cutting Station.
- Staff need no role to cut, only a PIN.

Built for the next step

- The station talks to the server through a small JSON interface identified by the station, not a signed-in user, ready for a dedicated tablet app; labels are also available as PDFs.
