Staff Scheduling

Marketing Blog — the schedule your staff actually see, built where your time clock and register already live.

POWERED BY AI

Every week, someone in your store builds a schedule in a spreadsheet, prints it for the break room, texts three people about Saturday, and finds out on Monday who never showed up. Indition Staff Scheduling puts all of that in one place — next to the time clock your staff already use and the register they already sign in to — and now an AI assistant can draft the week for you.

One week, one place

Most stores schedule in a spreadsheet. The schedule lives on one computer, the time clock in another system, and the changes in a group chat. Nobody is quite sure which version is the real one.

With Staff Scheduling, the week lives on one board, beside your time clock. Build it, check it, and publish it. From that moment your staff, your time clock and your reports all work from the same week — and until you publish, nobody is told anything.

Your staff are told what matters to them

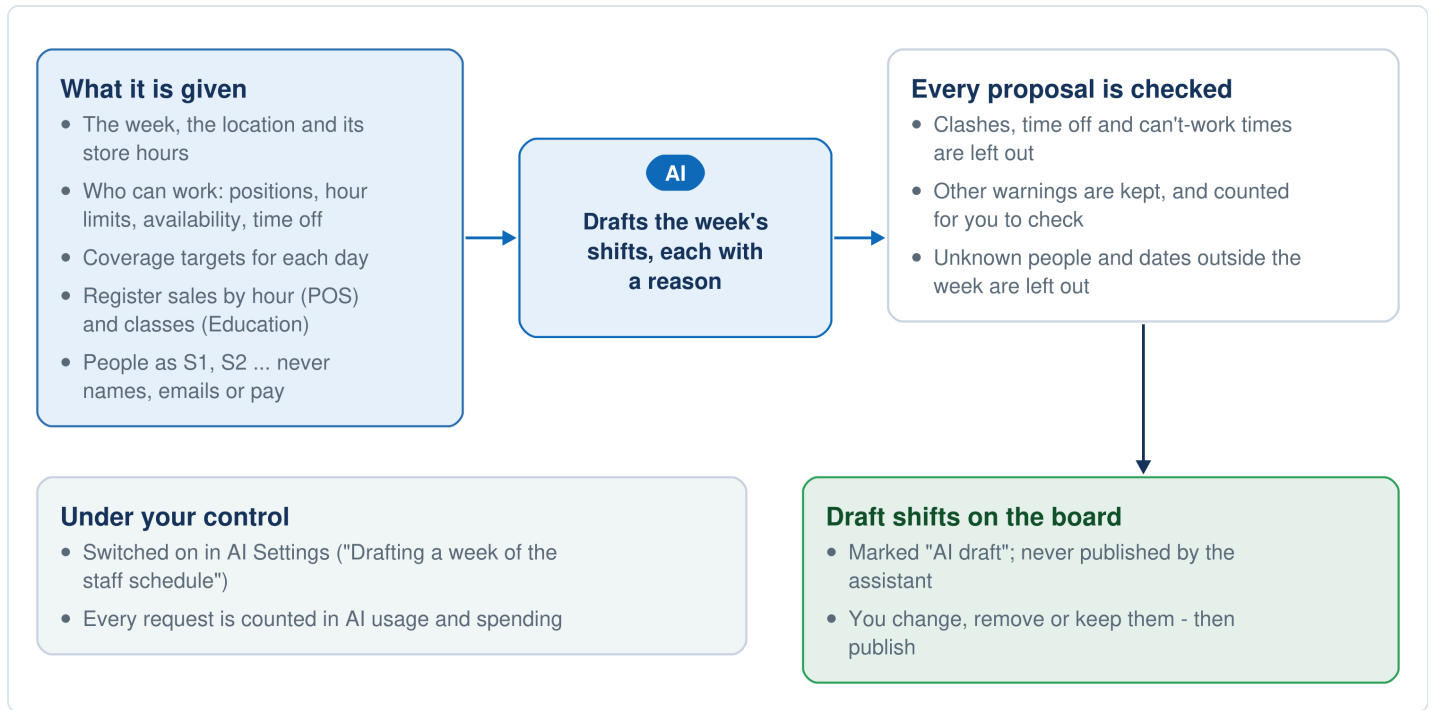

When you publish, each person hears only what changed for them: a new shift, a changed shift, a shift that is now someone else's. Nobody gets a flood of messages about other people's weeks. It arrives in their inbox, by email, or by text — and on My Schedule and in the Time Clock app on their phone, where they can see their week any time.

They can pick up open shifts, give a shift away, swap with a co-worker, ask for time off and say when they can't work — without a phone call. You approve with one click, and the schedule changes for everyone at once.

Let AI draft the week

The new AI Schedule Assistant drafts a whole week for a location. It knows who can work which jobs, everyone's hour limits, the times they can't work, their time off, how many people you need and when, your store hours, how busy your registers usually are hour by hour, and the classes on your calendar. Tell it "Saturday is our fall sale" and it plans for it.

It never sees your staff's names or pay — people are sent as S1, S2 and so on. Everything it proposes is checked like a shift you add yourself, and lands on the board as a draft for you to change or keep. Nothing reaches your staff until you publish.

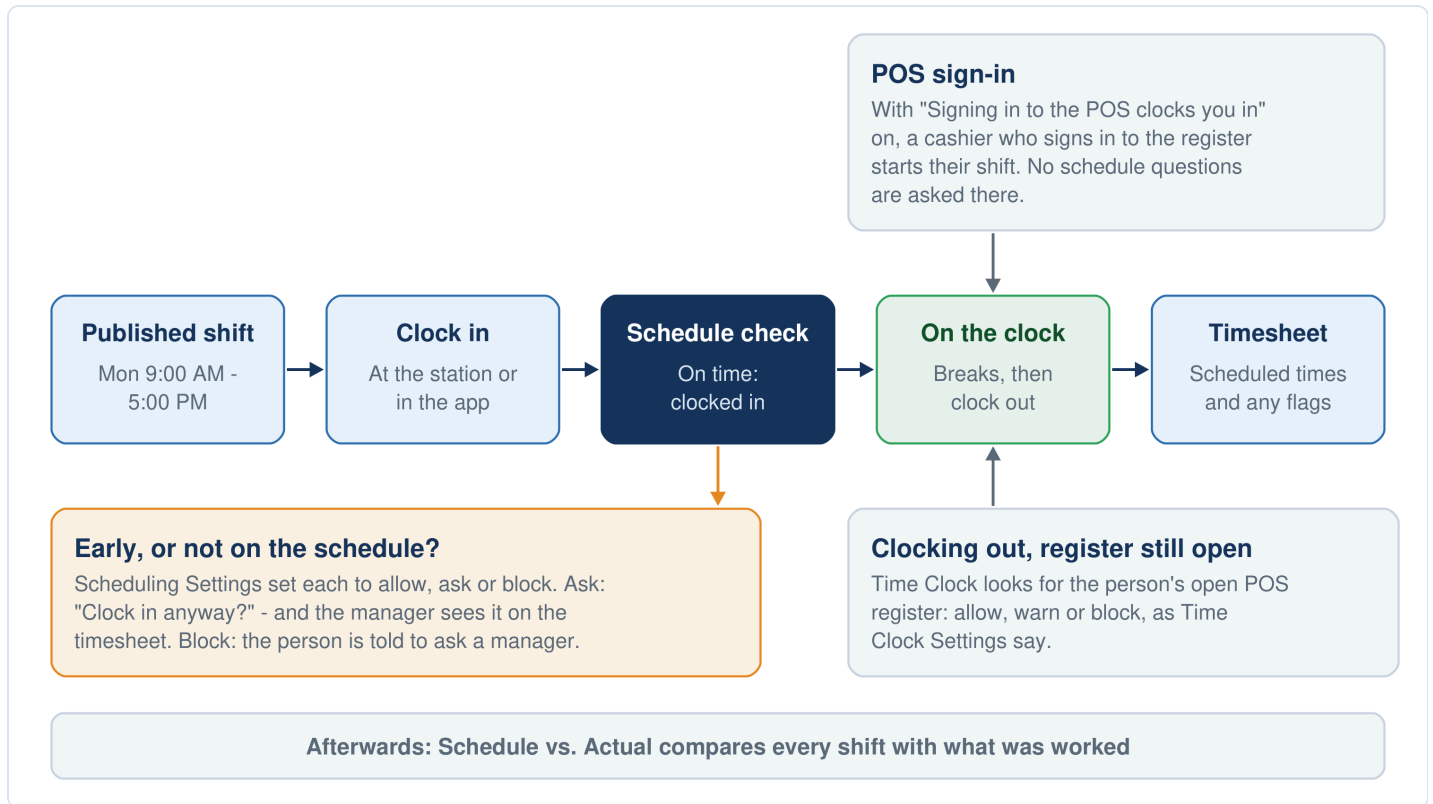

The AI Schedule Assistant drafts; you decide.

Fewer surprises at the time clock

Because the time clock knows the published schedule, it can ask someone who clocks in an hour early whether they really mean to — or stop them — and tell everyone when their next shift is. Timesheets show the scheduled times next to every clock-in. If someone hasn't clocked in a while after their shift started, their manager gets an email.

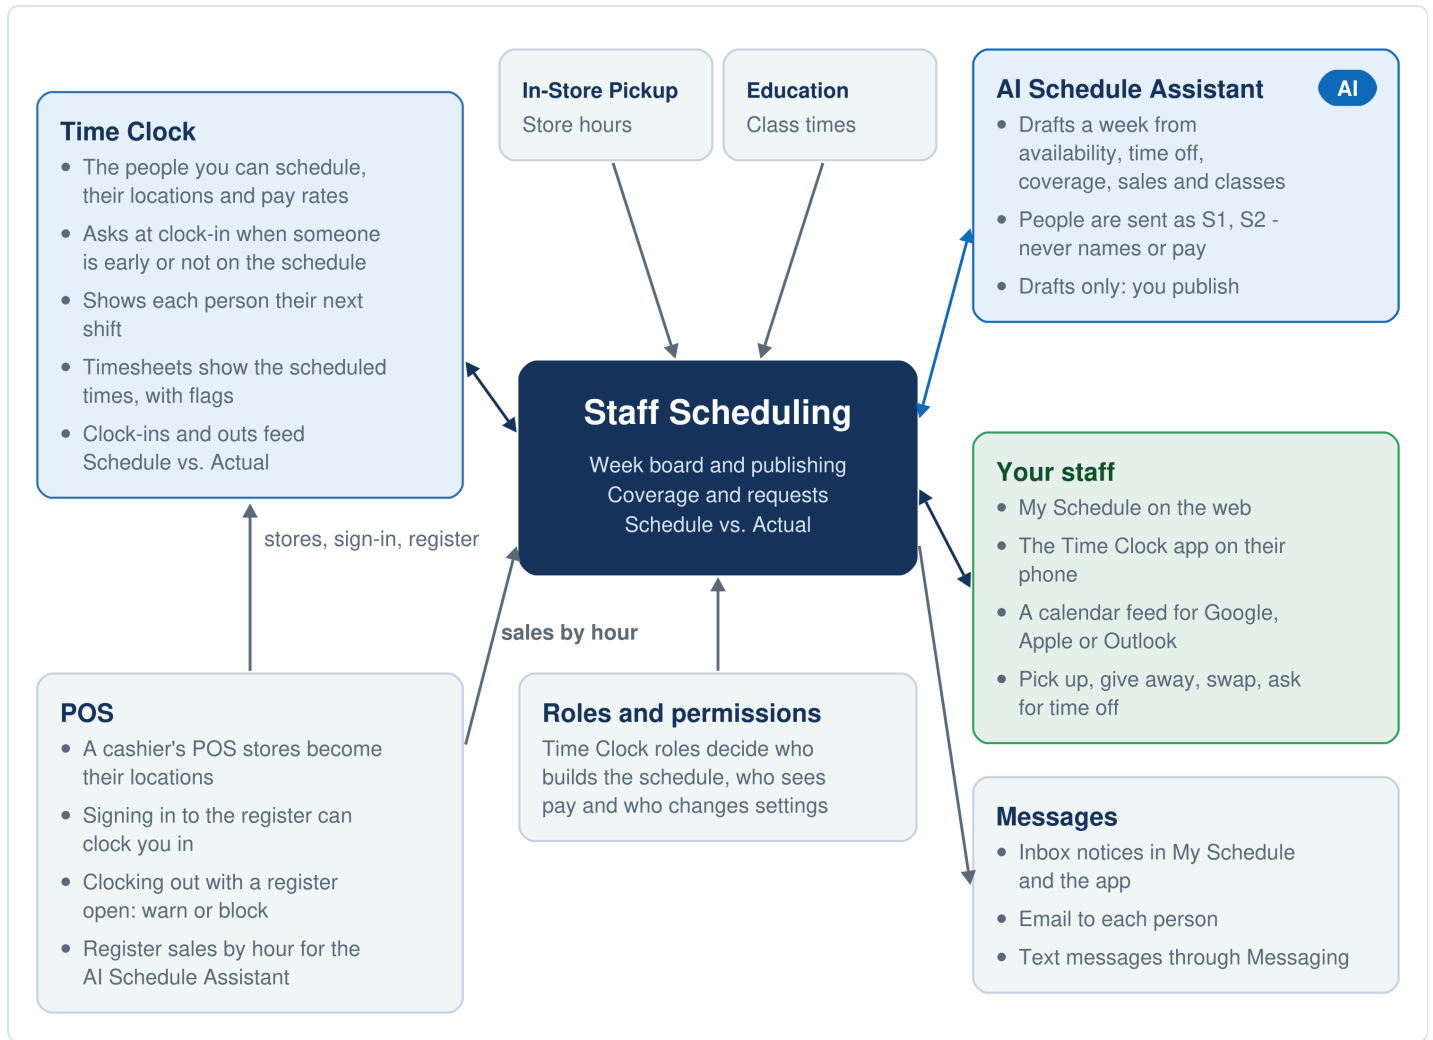

At the end of the week, Schedule vs. Actual shows who was late, who didn't come in, and how the hours compared — with the labor cost for whoever runs payroll.

From the published shift to the timesheet, with your POS in the loop.

Built into Indition

Staff Scheduling isn't another app to log in to. It uses the people on your time clock, the stores from your POS, your store hours and your classes — and it works whether you run one location or many.

One schedule, connected to the rest of your store.

Staff Scheduling is part of Indition Time Clock. Ask us to switch it on.
