Getting connected

- One-click install from the admin App Store — automatic enrollment with the master

catalog, nothing to configure

- No settings, by design - the connection is provisioned and pushed from the master, and

the app heals its own enrollment if access is ever re-provisioned

Browsing

- Every vendor offered to your store, with catalog size at a glance
- Paged product browsing with names, descriptions, SKUs, prices, and images
- IN MY CATALOG badges on products you already carry

Adding products

- Add Selected to My Catalog — complete products in a couple of clicks
- Add ALL on a vendor — the entire catalog queued and worked through automatically
- Everything carried across: product and SKUs (matched by vendor alias + SKU, never

internal ids), prices on your price levels, categories under your own tree, attributes and variant options, images from the master's optimized copies

- Match-before-create everywhere: existing categories, attribute groups, and

attributes are reused by name; only the genuinely new is created

- Your presentation stays yours — adding never overwrites store membership, pricing

rules, or content you already have

Staying current

- Automatic price and stock updates on the store's own schedule — local price locks

always win

- Catalog Updates inbox for everything that deserves review: content changes shown as

from/to diffs, discontinued-product alerts, and new-product offers, each applied or dismissed explicitly

- Per-vendor email notification when a vendor's catalog is refreshed (the bell toggle)

Under the hood

- All traffic over authenticated HTTPS APIs — the store never touches the master

database

- Images delivered from the master's size-capped, optimized copies — never raw vendor

originals

- Self-provisioning storage: the app creates its own tables and removes cleanly
